THESIS DECLARATION

I hereby certify that the work embodied in this thesis is the result of the original research and has not been submitted for a higher degree to any other University or Institution.

- OPEN ACCESS** I agree that my thesis is to be made immediately available as hardcopy or on-line open access (full text).
- EMBARGOES** I agree that is my thesis is to be made available as hardcopy or in-line (full text) for a period approved by the Post-Graduate Committee.
Dated from _____ until _____
- CONFIDENTIAL** (Contains confidential information under the Official Secret Act 1972)*
- RESTRICTED** (Contains restricted information as specified by the organization where research was done)*

I acknowledge that Universiti Malaysia Kelantan reserves the right as follows.

1. The thesis is the property of Universiti Malaysia Kelantan.
2. The library of Universiti Malaysia Kelantan has the right to make copies for the purpose of research only.
3. The library has the right to make copies of the thesis for academic exchange.

ACKNOWLEDGEMENT

This dissertation would not have been possible without the guidance and the help of several individuals who in one way or another contributed and extended their valuable assistance in the preparation and completion of this study.

A very deepest appreciation to my supervisor, Prof. Dr. Hj. Ibrahim Che Omar for his vital support, guidance, encouragement and for his dedication in clarifying doubts. He has been my inspiration as I hurdle all the obstacles in the completion of this research work.

Special thanks to my co-supervisor, Dr. Noor Azlina Ibrahim for the insights she has shared.

Dr. Hishamuddin Rahmat for his input especially in the methodology of the study and the relevance of the study to basic education not just in the technology sector.

The faculty members of FASA, UMK for ideas, continuous support, guidance and valuable comments in making this thesis. Despite the distance, they have painstakingly e-mailed the information needed.

Last but not least, my beloved family and Allah swt, for answering my prayers for giving me the strength to plod on despite my constitution wanting to give up.

3.2.1 Sources of isolates and sampling sites	43
3.2.2 Isolation and screening of lipase producing bacteria	45
3.2.3 Preparation of Luria Bertani (LB) slant agar and pre-culture	46
3.2.4 Preservation of lipase producing isolates	46
3.2.5 Cultivation of lipase producing bacteria into basal medium	47
3.3 Analysis of fermentation parameter	47
3.3.1 Bacterial growth rate	47
3.3.2 Lipase activity determination	48
3.4 Identification and characterization of lipase producing bacteria	49

3.4.1 Morphological properties	49
3.4.1.1 Gram's staining	49
3.4.1.2 Bacterial colony characteristics on agar media	50
3.3.2 Biochemical characteristics	51
3.3.3 Observation of bacteria using Scanning Electron Microscope	56
3.4.4 16S rRNA analysis	57
3.5 Lipase production medium and cultural conditions	58
3.6 Optimization of lipase production by <i>Bacillus cereus</i> UMK-HS6 by Response Surface Methodology (RSM)	60
3.6.1 Optimization of medium compositions	60
3.6.1.1 Effect of concentration of peptone	61
3.6.1.2 Effect of concentration of sodium chloride	61
3.6.1.3 Effect of concentration of olive oil	62
3.6.2 Optimization of cultural conditions	62
3.6.2.1 Determination of optimum temperature	63
3.6.2.2 Determination of optimum pH	63
3.6.2.3 Determination of optimum agitation rate	64
3.6.2.4 Determination of optimum inoculum size	64
3.7 Fermentation for lipase production by <i>Bacillus cereus</i> UMK-HS6 in conical flasks before and after optimization	65
3.7.1 Verification experiment	65
3.8 Lipase enzyme characterization of crude enzyme preparation	66
3.8.1 Determination of pH on the activity and stability of lipase	66

3.8.2 Determination of temperature on the activity and stability of lipase	67
3.9 Statistical analysis	67
CHAPTER 4 RESULTS AND DISCUSSION	
4.1 Isolation and screening of lipase-producing bacteria	69
4.1.1 Primary screening of lipase-producing bacteria	69
4.1.2 Secondary screening of lipolytic bacteria	73
4.2 Identification and characterization of lipase-producing bacteria	75
4.2.1 Morphological properties of isolates	75
4.2.2 Biochemical characteristics	78
4.2.2.1 Summary on biochemical characteristics	86
4.2.3 Identification using BBL Crystal Gram Positive ID Kit	90
4.2.4 Morphological and biochemical properties of isolate HS6	93
4.2.5 Observation under light microscope	94
4.2.6 Observation under scanning electron microscope	95
4.2.7 16S rRNA analysis	96
4.3 Lipase productivities by isolates on different cultivation media	104
4.4 Optimization of lipase production by <i>Bacillus cereus</i> UMK-HS6	106
4.4.1 Optimization of medium compositions	107
4.4.1.1 Effect of peptone on lipase production	112
4.4.1.2 Effect of sodium chloride on lipase production	113
4.4.1.3 Effect of olive oil on lipase production	114
4.4.1.4 Optimized medium compositions	119

4.4.2 Optimization of cultural conditions	120
4.4.2.1 Effect of temperature on lipase production	129
4.4.2.2 Effect of pH on lipase production	134
4.4.2.3 Effect of agitation speed on lipase production	137
4.4.2.4 Effect of inoculum size on lipase production	139
4.4.2.5 Optimized cultural conditions	140
4.5 Verification experiment	141
4.6 Characteristics of crude lipase from <i>Bacillus cereus</i> UMK-HS6	143
4.6.1 Effect of pH on the activity and stability of lipase	143
4.6.2 Effect of temperature on the activity and stability of lipase	145

Pengoptimuman Penghasilan Lipase Menggunakan Kaedah Gerak Balas Permukaan (*Response Surface Methodology - RSM*) Oleh Pencilan Baru, *Bacillus* sp. UMK-HS6

ABSTRAK

Sampel diperolehi daripada pelbagai sumber di sebuah kilang kelapa sawit yang terletak di Kulim, Kedah. Melalui ujian saringan menggunakan plat agar tributirin, bakteria yang menghasilkan enzim lipase akan membentuk zon hidrolisis. Kesemua 18 pencilan telah dikenalpasti berdasarkan kriteria seperti ciri morfologi, koloni dan sifat biokimia. Pencilan UMK-HS6 telah menghasilkan lipase yang maksimum (627 U/ml) dan dikenalpasti sebagai *Bacillus cereus*, sejenis bakteria Gram positif berbentuk rod melalui analisis 16S rRNA. Komposisi medium pertumbuhan yang optimum diperolehi daripada aplikasi Kaedah Gerak Balas Permukaan (*Response Surface Methodology - RSM*) ialah sebanyak 54.99g pepton, 2.92g natrium klorida serta 5.48ml minyak zaitun untuk penyediaan 1 liter yang boleh menghasilkan aktiviti lipase sebanyak 687 U/ml. Keadaan pengkulturan optimum dicapai apabila kepekatan inokulum *Bacillus cereus* UMK-HS6 yang diinokulasi ke dalam medium adalah sebanyak 7% pada keadaan pH 6.9 dengan kelajuan goncangan 234 psm selama 24 jam. Aktiviti lipase didapati meningkat melebihi 30% (1020 U/ml) menggunakan medium dan keadaan pengkulturan yang optimum. Enzim lipase ekstrasel kasar menunjukkan aktiviti yang maksimum pada nilai pH 6.0 dan suhu setinggi 30°C serta mempunyai kestabilan pada keadaan yang sama apabila dieramkan selama 25 jam.

**Optimization Of Lipase Production Using Response Surface Methodology By A
Newly Isolated, *Bacillus* sp. UMK-HS6**

ABSTRACT

Samples were collected from different sources in palm oil mill factory located in Kulim, Kedah. Screening of lipase producing bacteria was done on Tributyrin agar plate and formation of zone of hydrolysis was observed. Total of 18 isolates were characterized and identified based on morphological properties, colony characteristics and biochemical properties. Isolate UMK-HS6 was selected for its maximum yield of lipase (627 U/ml) and identified as *Bacillus cereus* via 16S rRNA analysis, a Gram positive bacilli. The optimum media composition derived from Response Surface Methodology (RSM) was consisted of (per liter): peptone, 54.99g; NaCl, 2.92; olive oil, 5.48ml with the lipase activity was 687 U/ml. Optimum culture conditions was observed when 7% of *Bacillus cereus* UMK-HS6 inoculated in the media containing above composition at pH 6.9 with agitation speed of 234 rpm for 24 hours. The lipase activity had increased more than 30% (1020 U/ml) upon the exposure in the optimum media and culture condition. Crude extracellular lipase enzyme was characterized for its activity and stability profile towards pH and temperature and both pH 6.0 and temperature, 30°C were observed to be the best condition for enzyme in 25 hours incubation.

CHAPTER 1

INTRODUCTION

- Research Background

Enzymes are protein and are considered as potential biocatalysts for a large number of reactions. Enzyme is a biological catalyst that regulates the rate of a chemical reaction in a living organism. In living systems, enzymes function in the transformation of macromolecules to energy and new materials, besides for growth, repair and maintenance of cells. Thus, all living things, particularly animal, plant and microorganisms are sources of enzymes. However, for commercial applications of industrial enzymes, microorganisms are the most important source of various enzymes. The production of enzymes from microorganisms can be controlled physiologically and physico-chemically. Furthermore, the enzyme quantities produced by microorganisms are far higher than that of the plant and animal sources. Enzymes have played an increased role in industrial processes since the scientific understanding of their catalytic function in the late nineteenth century up to now and the most popular enzymes are proteases, amylase and lipases for their application in daily and industrial used. For instance, many household cleaners use enzymes to speed up the breakdown of protein or starch stains on clothes.

A market research on world enzyme conducted by Freedonia Group Incorporated has reported that the world market for enzymes will recover from a difficult 2009 to reach \$7 billion in 2013 based on continued strong demand for specialty enzymes, as well as above average growth in the animal feed and ethanol production markets.

From a regional perspective, the developed economies of North America and Western Europe will achieve healthy gains, while the fastest growth will continue to come from the more rapidly developing economies of the Asia/Pacific and Africa/Mideast regions, as well as Latin America and Eastern Europe. With the world in a global economic downturn in 2009, however, the market for enzymes has become much more challenging, and growth will moderate significantly going forward.

Through 2013, world enzyme demand will average annual gains of 6.3 percent per year, led by pharmaceutical and biocatalyst enzymes, both of which will be less susceptible to the effects of lowered economic activity. Diagnostics enzyme demand will also fair well due to expanded access to medical care in developing countries, and the drive to achieve nearly universal health care in the United States.

In Malaysia, we have spent millions importing enzymes for industrial uses in variety products including detergent formulation, dairy products, shampoos, conditioners, cosmetics and pharmaceuticals. For example in 2003 alone, Malaysia purchased RM 28.3 million worth of enzymes as mentioned by Mhd Fairos Asillam, Head of Space Science Research, National Space Agency

to New Straits Time. It is possible for Malaysia to gain profit from practical applications of the global industrial enzyme market which worth RM 8 billion (\$ 3.3 billion) a year.

Lipolytic enzymes is one the industrial enzymes that was extensively researched on mainly on its application as catalysts in lipid modification. Lipolytic enzymes is a group of enzymes which is responsible for the hydrolysis of fats and oil consisting of lipase, esterase, phospholipase, and lipoprotein lipase. Today, lipases stand amongst the most important biocatalysts carrying out novel reactions in both aqueous and non-aqueous media (Shivareddy *et al.*, 2010). According to Gao *et al.*, (2000), lipases catalyze the hydrolysis of various fatty esters are widely distributed in animals, plants and microorganisms and microbial lipases is the one that find immense application since microbes can be easily cultivated and their lipases can catalyze a wide variety of hydrolytic and synthetic reaction. Lipases perform essential roles in the digestion, transport and processing of dietary lipids such as triglycerides, fats, oils in most, if not all, living organisms.

Presence of lipase is important to maintain optimal cell membrane permeability; this allows adequate nutrient supply into the cells and wastes to flow out. The biochemical function of lipase is to split fats into their components, specifically to remove two or all three fatty acids from their glycerol base in order to transport the individual components through the intestinal wall.

Interest of lipase has grown significantly in recent years (Fadiloglu & Erkmen, 2002) and widely used in industrial applications due to the wealth of reaction they catalyze and its versatility made them a unique heterogeneous catalyst for transesterification reactions (Nasratun *et al.*, 2009) and having lot of commercial applications (Shivareddy *et al.*, 2010).

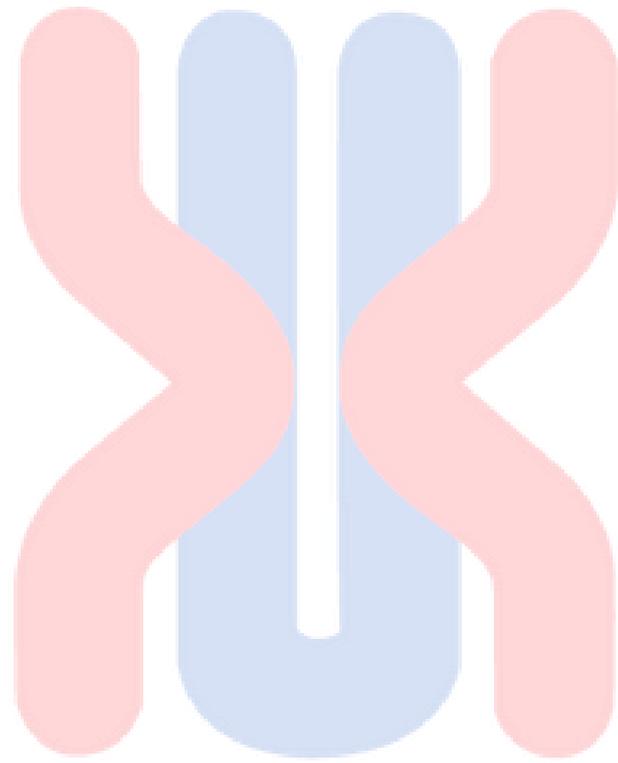

An ever greater industrial application of these enzymes would depend on the development of low-cost processes for the production of lipases (Elisa *et al.*, 2005). Lipases play the role in the postmortem quality deterioration of seafood (other foodstuffs) during handling, chilling frozen storage, and widely used for biotechnological applications in such dairy industry, oil processing etc. (Islam *et al.*, 2009). Lipases are also used in the synthesis of polymers, agrochemical leather textile, baking pharmaceutical and paper industry.

Most of the lipases used in industry are microbial enzymes, of both fungal and bacterial origin (Arpigny & Jaeger, 1999) as they are more stable compared to plant and animal lipases and can be obtained in bulk at low cost (Jyoti & Avneet, 2006). Lipolytic enzymes are currently attracting enormous attention because of their biotechnological potential (Arpigny & Jaeger, 1999). Lipases are widely use nowadays as they can be obtained from various sources.

In order to yield a better method of microbial lipases, Saxena *et al.*, (2003) have used a different strategy for the purification of bacterial, yeast and fungal lipases. Lipases find use in a variety of biotechnological fields such as food and dairy (cheese ripening, flavour development), detergent,

pharmaceutical (naproxen, ibuprofen), agrochemical (insecticide, pesticide) and oleochemical (fat and oil hydrolysis, biosurfactant synthesis) industries.

Enzymatic modification of fats and oils which are the triglycerides provides ambient reaction conditions unmatched in many chemical processes, for production of high-value products from cheap and plentiful raw material. Currently, the industrial hydrolysis of oils or fats employs alkaline high pressure steam splitting. This involves high energy utilization and yields a product requiring costly purification. The oxidation and polymerization of high value unsaturated fatty acids are unavoidable under these process conditions. Hence, it is not suitable for the splitting of the sensitive triglycerides or high value polyunsaturated oils. On the other hand, the applications of enzymes to oil or fat hydrolysis may create significantly less burden on the environment in terms of energy consumption and waste produced (Gan *et al.*, 1998). The dynamic nature of lipolytic enzyme technology has resulted active and continuous research in enzyme production systems using new and unique microorganisms, industrial enzyme applications and protein engineering.
